

# Сканирование дисков виртуальной машины

Для сканирования дисков используется команда `qm rescan`

```
$ qm help rescan
```

```
USAGE: qm rescan [OPTIONS]
```

Rescan all storages and update disk sizes and unused disk images.

```
-dryrun <boolean> (default=0)
```

Do not actually write changes out to VM config(s).

```
-vmid <integer> (1 - N)
```

The (unique) ID of the VM.

```
# Using this we can construct the rescan command with a dryrun to doublecheck
```

```
$ qm rescan --vmid [id] --dryrun
```

```
VM XXX add unreferenced volume 'storage:XXX/vm-XXX-disk-0.qcow2' as 'unused0' to config
```

```
# Now the real command
```

```
$ qm rescan --vmid [id]
```
